Evergreen Landscape Pros Expands Restoration and Maintenance Services

July 23, 2026

SANTA FE, NM - July 23, 2026 -
Evergreen Landscape Pros has expanded its landscape restoration and maintenance services this year, widening the range of work available to residential and commercial property owners across the Santa Fe region. The broadened program pairs the rehabilitation of declined or damaged outdoor spaces with recurring seasonal upkeep handled by a single provider.

The restoration portion of the expansion focuses on landscapes that have deteriorated because of drought stress, soil depletion, erosion, or extended periods without care. Work in this category includes soil rehabilitation, repair and upgrading of irrigation systems, replanting with regionally suited species, and correction of grading and drainage issues that contribute to plant loss. The intent is to return neglected or struggling properties to a stable and functional condition before regular care begins.

The maintenance side of the expanded offering covers the ongoing tasks that keep restored and established landscapes healthy as conditions change through the year. Among the services included are mulching, flower bed care, seasonal pruning, weed and pest management, irrigation adjustment, debris removal, and winter snow removal. Snow removal, in particular, addresses a winter hazard at the region's elevation, where

accumulation can damage plantings and create unsafe conditions on walkways and drives. Scheduling this work on a recurring basis is meant to limit the gradual decline that often follows a single one-time cleanup.

"The expanded services give property owners a single source for both reviving struggling landscapes and keeping them healthy through every season," said Kevin Lopez, owner of Evergreen Landscape Pros. "Restoration corrects problems that have already taken hold, and ongoing maintenance is what keeps those problems from coming back."

The expansion responds to conditions that are common across northern New Mexico, where a semi-arid, high-desert climate and constrained water supplies place sustained pressure on outdoor plantings. Santa Fe sits at an elevation of roughly 7,000 feet, and its dry summers and cold winters can damage landscapes that were not designed or maintained for the local environment. Combining restoration with consistent maintenance is intended to interrupt the cycle of decline and replacement that many properties in the area experience.

Northern New Mexico has experienced recurring drought across recent years, and periods of below-average precipitation have left many established yards and commercial grounds in poor condition. Outdoor plantings that were installed for a wetter pattern, or that depend on heavy watering, are particularly vulnerable when supplies tighten. Restoration that incorporates lower-water species and corrected irrigation is one way property owners can rebuild a landscape suited to the conditions that the region is likely to keep facing.

Rather than treating restoration and maintenance as separate one-time projects, Evergreen Landscape Pros structures them as connected services, so that a property which has been rehabilitated can move directly into a regular care schedule. This approach reflects a broader shift across the Southwest toward water-conscious landscaping, including the wider use of drought-tolerant and native plantings that require less irrigation once they are established. Pairing those plantings with steady upkeep is meant to protect the investment a restoration represents.

"The goal of the expanded program is continuity rather than a series of disconnected visits," said Lopez. "A landscape that is restored and then maintained on a regular schedule holds its condition far longer than one that is repaired and then left alone."

The expanded services are available to homeowners, property managers, and commercial sites throughout the Santa Fe area, covering projects that range from the recovery of a single neglected yard to the continued upkeep of larger grounds. By handling both phases with one team, the company aims to keep the results of a restoration from eroding, so that the condition achieved is preserved across the seasons that follow. The combined structure also gives property owners a consistent point of contact for needs that shift from spring planting to winter snow clearing.
